ABSTRACT

To measure stereotypes of the 518 most common women's names along six dimensions (Good-Bad, Strong-Weak, Active-Passive, Sincere-Insincere, Intelligent-Dumb, and Calm-Emotional), this study administered the Osgood semantic differential to 250 male and 250 female college students. While previous research has been done on the first three of these dimensions, this is the first time the procedure has been used with six dimensions on women's names. Results confirm that there are differential stereotypes, and that there are a number of significant differences in the perceptions of men and women. An additional finding is a high correlation of the attitudes of men and women except of the Calm-Emotional dimension, possibly due to differing attitudes about which is the more positive dimension. The conclusion may be drawn that these differential perceptions and stereotypes lead to differential treatment and to variations in the self-esteem of the individuals affected. Three tables contain 23 pages of comparative statistics from the study. Contains 9 references. (LB)

Abstract

To measure stereotypes of the 518 most common women's names along six dimensions, Good-Bad, Strong-Weak, Active-Passive, Sincere-Insincere, Intelligent-Dumb, and Calm-Emotional, the Osgood semantic differential was administered to 250 men and 250 women. While previous research has been done on the first three of these dimensions, this is the first time the procedure has been used with six dimensions on women's names. Results confirm that there are differential stereotypes, and further, there are a number of significant differences in the perceptions of men and women. The conclusion can be drawn that these differential perceptions (and stereotypes) lead to differential treatment, and to variations in the self-esteem of the individuals affected.

Psychological Dimensions of Women's Names:**A Semantic Differential Analysis**

At the 1984 meeting of the International Congress of Onomastic Sciences in Leipzig, stereotypes held by men and women on over 450 men's names were reported. That research used the semantic differential (Osgood, Suci, & Tannenbaum; 1957) to measure attitudes on six dimensions: three were the original ones of Osgood et al., Good-Bad, Strong-Weak, and Active-Passive and three additional ones, Sincere-Insincere, Intelligent-Dumb, and Calm-Weak. The results indicated: (1) there were different stereotypes of names, (2) there were general correlations between men and women on five of the dimensions, but there were also many significant differences on the names, and (3) that frequency of a name was correlated with its score on the dimensions.

This investigation with over 500 women's names is a follow-up to that one. The basic methodology is the same.

Method**Concepts/Names Rated**

Reference concepts and names were rated. The reference concepts were GOOD and BAD, STRONG and WEAK, and ACTIVE and PASSIVE, which were to represent the poles of three assumed axes of Evaluation (E), Potency (P), and Activity (A). In addition, SINCERE and INSINCERE, INTELLIGENT and DUMB, and CALM and EMOTIONAL were included to measure poles on new dimensions.

The list of 518 women's names was taken from Dunkling (1977) who gives the estimated frequencies per 10,000 births for names

in the United States. In addition, the 1970 and 1983 first name frequency lists of the Office of Vital Statistics of the New York State Health Department were consulted.

The specific testing instrument used a set of rating scales for each concept or name evaluated. Each set has nine 7-step subscales: (1) Kind-Cruel, (2) Weak-Strong, (3) Fast-Slow, (4) Cold-Hot, (5) Large-Small, (6) Dishonest-Honest, (7) Happy-Sad, (8) Delicate-Rugged, and (9) Sharp-Dull (the polarity of the scales is alternated to avoid a directional tendency). Scales 1, 6, and 7 measure the E factor; 2, 5, and 8, the P; 3, 4, and 9, the A. In practice, the 12 reference concepts, GOOD, BAD, STRONG, WEAK, etc. were presented in random order, followed by 52 names, also in random order. The respondents were organized into 10 groups of 25 men and 10 groups of 25 women.

Respondents

The respondents were 500 students (250 men and 250 women) at State University College, Fredonia who chose participation in a research project as a way of earning a small amount of extra credit in an introductory psychology course. Testing was done in group sessions with conventional semantic differential instructions.

Results

Results were analyzed using several computer programs developed for use with the semantic differential by Lawson, Metivier and Metivier (1984a, 1984b). One of the measures for analysis suggested by Osgood is the D (Distance) score. The D

score is essentially a difference profile between ratings of two concepts on the same subscale. Thus, scores on the nine subscales (Kind-Cruel, Weak-Strong, Fast-Slow, etc.) for the concept GOOD would represent one profile, scores for the concept BAD, another profile. The D score is the sum of the differences on the subscales and is found by the generalized distance formula $D = \sqrt{d^2}$ in which d is the difference in ratings of two concepts on the same subscale. The d's of the nine subscale scores were combined into a single D score. For concepts or names perceived as being close, such as GOOD and ETHICAL, D would be small; for concepts far apart, such as GOOD and BAD, D would be large. For each participant, D scores were computed between each concept and each name.

The Wilcoxon matched pairs procedure (Wilcoxon & Wilcox, 1964) was used with the D's for each name and reference concept to determine the degree of proximity to either GOOD or BAD, STRONG or WEAK, ACTIVE or PASSIVE representing the E, P, and A dimensions. Similar computations were done for the new dimensions of Sincerity, Intelligence, and Emotionality. The significance levels of the Wilcoxon tests can be expressed in probability levels and standard scores. However, for clarity, all of the original standard scores were recalculated on a range from 0 to 100, with the high scores at the more positive end of the dimension. These results are shown in Table 1.

Thus, reading the scores in Table 1 on the Good/Bad dimension, the score by men for MARY of 86 is actually so close

to GOOD rather than BAD that the probability of this occurring by chance is $<.01$. The score for women of 100 has a significance level of $<.0001$. Scores were similarly derived for other dimensions. The probability levels for the scores are shown at the bottom of Table 1.

The average scores were computed on the basis of the first five dimensions. Experience with the men's names had shown that the sixth dimension, Calm-Emotional did not correlate with the other dimensions and this was confirmed with the women's names.

Please insert Tables 1 and 2 about here

When comparisons are made between the sexes, several computations have to be made using the Mann-Whitney test for independent groups (Siegel, 1956). Because of the nature of the semantic differential, the assumed axes for E, P, and A (and probably other dimensions as well) vary in length from sample to sample. Thus, in order to test whether LINDA (rating on Strong by men is 78; by women, 46) is really rated differently, it is first necessary to compare the STRONG-LINDA scores for men with those of women. It is also necessary to compare the WEAK-LINDA scores for men with those of women. These comparisons show that the STRONG-LINDA scores differ at the .05 level which is indicated by the suffix letter a following the scores of 78 and 46 to indicate the difference level. The WEAK-LINDA differences

are not significant. In this report the suffix letters indicate significance level between the name and either reference concept.

For further information on the procedure, see Lawson, Metivier, and Metivier (1984b).

In order to obtain some idea of the overall trend of the names, averages were computed on the six dimensions for men and for women. Table 1 also shows in the last column the rank for frequency of the names on the Fredonia campus. The names which were not on the campus have an asterisk.

Table 2 shows the Fredonia names in rank order, the most common name, Mary, ranks first followed by the others. It was possible to rank only the first 299 names since only that number appeared on the campus during the time of this investigation. Also, it is to be noted that there were a number of ties. This is accounted for by a number of names with the same frequency.

Please insert Table 3 about here

Another way of looking at the data is to select from the sample of 518 names those names with the highest average scores and those with the lowest. The top 20 and the bottom 20 were chosen for each sex. These results are shown in Table 3. For these extreme groups the relationship between the averages and frequency can be examined. Thus, for the men, 16 of the top-rated names were on the campus, but only five of the

lowest-rated names. For the women, 10 of the names in the high group were on the campus and four in the low group, giving a somewhat ambiguous picture. So, for men, there appears to be some relationship between frequency of women's names and its positive value. This is not true for women.

Further analyses were performed by correlating scores on the names between men and women and by frequency as is shown in Table 4. The correlations between men and women are .39 or higher, which is highly significant, on all of the dimensions except Calm-Emotional. These compare with correlations of .53 or higher in the investigation with men's names, again, except for the Calm-Emotional dimension.

Please insert Table 4 about here

The final correlations report the relationship between dimensions and frequency. It might be well to first recall the results with the men's names. There, significant correlations occurred between frequency and all dimensions except for the women on Calm-Emotional. However, with women's names the results as shown in Table 4 show a mixed picture. While frequency correlates with both averages, the other correlations are with Good, Sincere, and Intelligence for men; with Intelligence only, for women.

Discussion

The results of this investigation confirm that differential stereotypes exist on a large number of women's names. Also, there is a substantially high correlation of the attitudes of men and women except on the Calm-Emotional dimensions (while the men/women scores are correlated, there are, however, still a number of significant differences of individual names).

The correlations between frequency of a name and its dimension scores have been shown to be significant in four measures with men but in only two with women. Thus, the role of frequency in regard to evaluation of women's names is ambiguous.

The difficulties with the Calm-Emotional dimension were somewhat forecast in the previous research with men's names. Perhaps this is related to basic differences between the sexes in the perception of the dimension itself. Post-survey interviews give some indication that men associate CALM as opposed to EMOTIONAL as desirable, as control vs. impulsiveness, whereas women make the association of CALM with emotional coldness; EMOTIONAL with warmth or sensitivity. So, for men, CALM is a positive value, but for women, EMOTIONAL is a positive value.

A general pattern also seems to appear in that for men's names, the frequency of the name is positively associated with the dimensions. This is true for both men and women. For women's names, only men show correlations between frequency and dimension and this on four of the seven possible relationships.

How can we account for this? Fortunately, the Lawson 1980 study also had the concepts IDEAL MAN and IDEAL WOMAN. Those results indicate that both men and women see the IDEAL MAN as having high scores on the Good, Strong, and Active dimensions. The IDEAL WOMAN has a score as high as that of IDEAL MAN on Good but considerably lower scores on Strong and Active.

These differences in perception may explain part of the failure to find relationships between frequency and Strong and frequency and Active. On women's names, however, there may be an additional factor. In general, the literature on names seems to suggest that where men's names are concerned, both sexes like popular names. With women's names, variation seems to be more the pattern with the popularity of women's names being more cyclical.

One possible approach for further investigation would be to determine whether there is a relationship between the semantic distance between the IDEAL WOMAN and each name on each dimension and frequency, the hypothesis being that those names closest to IDEAL WOMAN on the six dimensions would have the greatest frequencies.

518. Yvonne	58	56	64	67	53	61	74	63	84	74	31	74	66.6	64.2	263.0		

Note. Within each group the following scores are significant at the levels indicated: 21-27, 73-78 $<.05$; 14-20, 79-86 $<.01$; 7-13, 87-93 $<.001$; 1-6, 94-99 $<.0001$.

Differences between names on the same dimension within a sex group are probably significant at the .05 level if they are 17 units apart. The significance level of the differences between the sexes is indicated by suffix letters following the comparison pairs, $a = p < .05$, $b = p < .01$, $c = p < .001$.

In determining the significance of scores between the sexes, not only is the average or mean score important, but also the pattern of the scores.

Average scores for men and women were computed on only the first five dimensions since the Calm-Emotional dimension did not correlate with the others. As mentioned in the text, Calm appears to be a positive attribute for men whereas for women, Emotional appears to be more of a positive attribute.

446. Sallie	91	86	44a	28a	22	20	85	90	75a	50a	46	52	63.4	54.8	263.0		

Note. The last column shows the rank of each name based on frequency. Thus, Mary was the most common name on the campus and has a rank of 1. Many names were tied in frequency resulting in giving the same rank to more than name. Barbara and Kathleen both tied for position after rank 6, taking places 7 and 8. This resulted in the rank of 7.5 being divided between them.

For further information, please see the note at the end of Table 1.
